

8. Different Types of Software with Examples A Complete Guide

Answer the questions below *in English* :

1. How does the article describe software?
Instructions that direct a computer's operations
2. The article distinguishes different types of software. What are they?
System software, application software, programming software, devops software, embedded software, open source/proprietary software (6)
3. How does the article describe the first type of software?
Manage the computer and help hardware and software work together.
4. The article names some common instances of that first type of software. What are they and how are they described?
 - Operating System (OS) – runs the computer and lets other programs work (Windows, macOS, Linux, Android).
 - Device Drivers – small programs that let hardware talk to the OS (printer or keyboard drivers).
 - Utility Software – tools that maintain the computer (antivirus, disk cleanup, backup).
5. How does the article describe the second type of software?
Programs made for specific tasks like writing, drawing, studying, or gaming, used by end users.
6. The article names some common instances of that second type of software. What are they and how are they described?
 - Productivity Software – tools for work like writing, spreadsheets, and presentations (Microsoft Office, Google Workspace).
 - Multimedia Software – handles audio, video, images, and animations (Photoshop, VLC).
 - Web Browsers – let users access websites and online tools (Chrome, Firefox, Safari).
 - Communication Software – apps for messaging, calls, and teamwork (Zoom, Slack, Teams).

7. How does the article describe the third type of software?

Programming software allows coders to write and test programs. It's used to create other software.

8. The article names some common instances of that third type of software. What are they and how are they described?

- Code Editors – programs for writing code (VS Code, Sublime Text).
- Compilers & Interpreters – convert code into machine language (compilers: whole program; interpreters: line by line).
- Debuggers – find and fix errors in code.

9. How does the article describe the fourth type of software?

Connects development and operations, automates processes, and simplifies deployment.

10. The article names some common instances of that fourth type of software. What are they and how are they described?

- Configuration Management Tools – manage servers and keep environments consistent (Ansible, Puppet, Chef).
- CI/CD Tools – automate build, test, and deployment (Jenkins, GitLab CI, CircleCI).
- Containerization & Orchestration Tools – run and manage applications in containers (Docker, Kubernetes).
- Monitoring & Alerting Tools – track system performance and warn of issues (Prometheus, Datadog, New Relic).

11. How does the article describe the fifth type of software?

Pre-installed software in devices like IoT gadgets, medical equipment, and robots, running in real time.

12. The article names some common instances of that fifth type of software. What are they and how are they described?

- Firmware – embedded code in hardware that helps devices start and communicate (router, washing machine).
- Real-Time Operating System (RTOS) – manages time-critical tasks with high accuracy (pacemakers, car brakes).

13. At the end of the article, software is categorized in another way. What is this categorization based on and what (sub)types are distinguished?

Software is categorized based on ownership and access.

- Open Source Software – free to use, modify, and share (Linux, Apache, Git).
- Proprietary Software – owned by a company; requires a license to use (Windows, Adobe Creative Suite).
